

Behavioural Optometry Assessments

Behavioural Optometry takes a holistic approach to your child's vision. We understand that vision is a dynamic process of gathering and interpreting information, not just seeing clearly. While a standard eye test checks for sight clarity (20/20 vision) and eye health, a Behavioural Optometry Assessment goes much deeper. We evaluate all the essential visual skills your child needs to succeed in the classroom and in life.

Sometimes, a standard eye test isn't enough. Your child might be able to see the board perfectly, but how their brain uses that information is the key to learning and development.

Look for these common signs:

While Reading & Writing:

- Skips words or entire lines
- Loses their place frequently
- Uses a finger to track words
- Complains of words blurring or moving
- Reverses letters or words (like 'b' for 'd') after age 7
- Has messy or poorly spaced handwriting
- Struggles to copy from the board
-

In the Classroom & at Home:

- Avoids reading, writing, or homework
- Has a short attention span, especially for close-up tasks
- Complains of headaches, tired or sore eyes
- Struggles with ball sports or coordination
- Seems clumsy or accident-prone
- Tilts their head or covers one eye

If you've noticed any of these signs, it could be a sign of a vision problem that goes beyond just clarity.
